Updated LinkedIn Profile Guide – Shri Sanjaykumar V

Target Profile:
https://www.linkedin.com/in/shri-sanjaykumar-v-588bab28a/

> Important Pre-Publication Verification & Confidentiality Check:
> 1. Factual Consistency: Before updating your live LinkedIn profile, verify your current official VIT transcript CGPA (9.12/10.0) and exact internship dates (Aug 2026 – Oct 2026).
> 2. Defensible Claims Only: All copy-paste sections below describe FinDoc-AuditEngine accurately as a working prototype / internship capstone deliverable and avoid unbenchmarked latency claims or raw test counts.
> 3. Company Confidentiality Policy: Confirm with your Linkific mentor which repository links or screenshots are approved for public sharing. The FinDoc-AuditEngine codebase uses 100% synthetic demonstration data (benchmark_invoices.json) and contains no proprietary Linkific code or client data.

1. Recommended LinkedIn Headline Options (220-Character Limit)

Option A – Recommended (Balanced SWE + AI/ML)

AI/ML Software Engineering Intern @ Linkific | Ex-GenAI Intern @ TForce India | M.Tech Integrated SWE @ VIT Vellore (9.12 CGPA) | Python, FastAPI, RAG, Applied ML & Microservices | Oracle Certified

Option B – Backend & Applied AI Focus

Software & AI Engineering Intern @ Linkific | Ex-TForce India (GenAI/RAG) | M.Tech SWE @ VIT Vellore | Python • FastAPI • Java • REST Microservices • RAG • scikit-learn • Cloud

2. Updated "About" Section (Copy-Paste Ready)

I am an M.Tech Integrated Software Engineering student at Vellore Institute of Technology (CGPA: 9.12/10.0) focused on building modular backend microservices, Retrieval-Augmented Generation (RAG) workflows, and explainable machine learning applications.

Across my internships at Linkific (AI/ML Software Engineering Intern) and TForce India Private Limited (Software Engineering Intern – Generative AI), I have worked on connecting software engineering practices with practical AI workflows:

• Applied Financial AI Prototype (Linkific): Built FinDoc-AuditEngine, a FastAPI capstone prototype for Accounts Payable reconciliation that combines deterministic 3-Way Matching (Invoice–PO–GRN), regex-based PII masking, and a 7-feature Isolation Forest anomaly scorer with perturbation-based feature attribution.

• Enterprise RAG & Backend Microservices (TForce India): Engineered context-grounded Retrieval-Augmented Generation (RAG) workflows using Python, SAP BTP, and the SAP Generative AI Hub SDK, integrating AI components into modular RESTful services.

• Software & ML Projects: Built LEGITIFY (automated DevSecOps repository compliance analyzer), CampusLLM (university RAG assistant with vector search and query routing), FinTrack (multi-party graph debt-settlement platform), and a 5-model Solar Energy Forecasting pipeline (Linear Regression, Random Forest, XGBoost, Gradient Boosting, LSTM).

• Leadership & Operations: Served as Purchase Manager for VIT's Riviera & Gravitas festivals (helping secure INR 60+ Lakhs in sponsorships and managing procurement workflows) and Vice Chairperson of the VIT Health Club (leading "Hack the Hospital" for 600+ participants).

Core Technical Stack:
• Languages: Python, Java, C++, C, TypeScript, JavaScript, SQL
• Backend & Engineering: FastAPI, REST APIs, Microservices, Pydantic v2, PyTest, Docker, GitHub Actions CI/CD, AWS (EC2), Azure (VMs, NSG), Linux
• AI & Machine Learning: RAG, Vector Search, Agentic AI, scikit-learn, Isolation Forest, XGBoost, LSTM, OpenAI API, SAP Generative AI Hub SDK

Open to Software Engineering (SDE) and AI/ML Engineering roles. Contact: v.shrisanjaykumar@gmail.com

3. Experience Section – Linkific Entry (Copy-Paste Ready)

- Title: AI/ML Software Engineering Intern
- Employment Type: Internship
- Company: Linkific
- Dates: Aug 2026 – Oct 2026
- Description:

• Developed FinDoc-AuditEngine, a FastAPI capstone prototype for Accounts Payable auditing that combines deterministic 3-Way Reconciliation (Invoice vs. Purchase Order vs. Goods Receipt Note) with a 7-feature StandardScaler + Isolation Forest anomaly scoring model trained on a seeded synthetic baseline.

• Implemented local single-feature perturbation attribution to highlight the top risk drivers behind flagged invoices, alongside regex-based pre-inference PII masking for PAN, Aadhaar-formatted numbers, bank accounts, phones, and emails.
• Built an interactive HTML/CSS/JS audit workbench supporting dual-currency (USD/INR) line-item inspection, unstructured invoice-text parsing, and CSV ledger export, backed by Pydantic v2 validation and automated PyTest suites.

4. Project Section Entry – FinDoc-AuditEngine (Copy-Paste Ready)

- Project Name: FinDoc-AuditEngine – Financial Reconciliation & Anomaly Scoring Prototype
- Description:

Built a working FastAPI prototype demonstrating hybrid Accounts Payable auditing: combines deterministic SKU-level 3-Way Matching (Invoice–PO–GRN), regex-based pre-inference PII masking, and a 7-feature Isolation Forest anomaly indicator with perturbation feature explanations and 5-tier approval routing.
